[NTLM](#) is a protocol used to authenticate against a variety of Microsoft products.

NTLM is not a [recommended authentication](#) protocol, but sometimes it's the best there is.

Now it's possible to do NTLM authentication over HTTP via ABAP!

I started the project <https://github.com/larshp/abapNTLM> back in 2015, and now it finally polished, thanks to [Kasper Vilhelm Torp](#)

Highlights:

- Custom ARC4 implementation, [ABAP](#), [specification](#)
- Custom MD4 implementation, [ABAP](#), [specification](#)
- Custom DES implementation, [ABAP](#), [specification](#)

For each commit to the open-source project, [abaplint](#) is triggered to perform static analysis and style checks.

Additionally, all unit tests are executed for each commit! The unit tests run on GitHub Actions, see the [workflow configuration](#).
