## ABAP: Now is the perfect time to start using abapGit and GitHub

**Lars Hvam Petersen** ✓  
Senior SAP/ABAP Consultant at Heliconia Labs

October 7, 2025

Its never been a better time to start using [abapGit](#) and [GitHub](#) for **ABAP** development, below is my list of the most important reasons for usage,

### Transparency

Put your ABAP code on GitHub, and your entire organization will have access to read it. By using [pull requests](#) its easy to get an overview about what is happening and what is not.

It will help promoting inner source, allowing anyone to give suggestions and feedback. Along with easy backup and reference of the entire codebase.

### Collaboration

Increase collaboration in your team by doing structured code review, increasing knowledge about the change and facilitating discussions.

### Any version

abapGit works on version 702 and up, so there is no need to upgrade to latest S/4 HANA to get the latest features, update at your own phase when you have time.

### SAP doesn't have to be special snowflake

Work with processes like the rest of your IT organization, increasing cross team understanding and collaboration.

### Shift left feedback

Shift feedback from static analysis and unit tests left, don't wait until the development is done to trigger feedback from tooling. Tools are automatically executed for each commit, without the developer having to remember what and how to run tools.

## Immediate AI enabling

Put the code on GitHub, and you have **immediately enabled** your developers to work with agentic AI using the latest models.

## Battle tested

abapGit is 10 years old, built by the community for the community, supporting the most common **object types**, and is continuously evolving. It is tested to work with up to 100k files supporting large custom codebases.

Lets go! You can start today 🤖
