## ABAP Cloud: Getting rid of those pesky macros

**Lars Hvam Petersen**

July 15, 2024

The ABAP Cloud Programming Model does not allow using **macros**, however lots of old code still use macros, so how do we easily convert code to be cloud compatible?

### Naming

ABAP is a programming language with many language constructs, and macros can easily make it more confusing. A macro named MULTIPLICATION can easily look like part of the language instead of a macro

```
MULTIPLICATION foo bar.
```

So if using macros, I like prefixing(ya ya) all macro names with an underscore enforced via [https://rules.abaplint.org/macro\\_naming/](https://rules.abaplint.org/macro_naming/)

This makes it much easier to tell if there is something dodgy happening,

```
_MULTIPLICATION foo bar.
```

### Inlining

Anyhow, macros cannot be used in the ABAP Cloud Programming Model, and most cloud/should be refactored to method calls. But in code maintained for Classic ABAP, there might be scenarios where the macros are preferred.

To automatically make the code ABAP Cloud compatible [https://rules.abaplint.org/expand\\_macros/](https://rules.abaplint.org/expand_macros/) can be used, it will automatically take the macro contents and inline it instead of the macro call, try it out with above link. This can run both in [vscode](#) and in Continuous Integration pipelines.

## Removing

When the macro call is removed the rule [https://rules.abaplint.org/unused\\_macros/](https://rules.abaplint.org/unused_macros/) will trigger suggesting the remove the macro. Note that this is also useful when refactoring old code, reminding the developer if a macro becomes unused.

And voila, one problem making ABAP code cloud compatible is solved 🤖
