Which ABAP unit tests to execute when and where?

Lars Hvam Petersen
Senior SAP/ABAP Consultant at Heliconia Labs

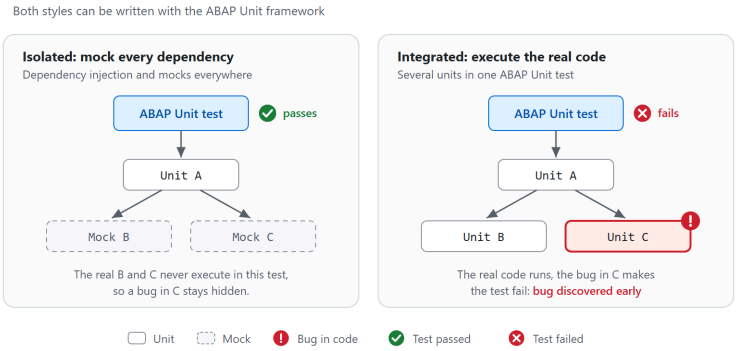

October 29, 2026

If your unit tests only touch the object they belong to, the answer is easy: run the tests for the object you changed. Just remember to run them

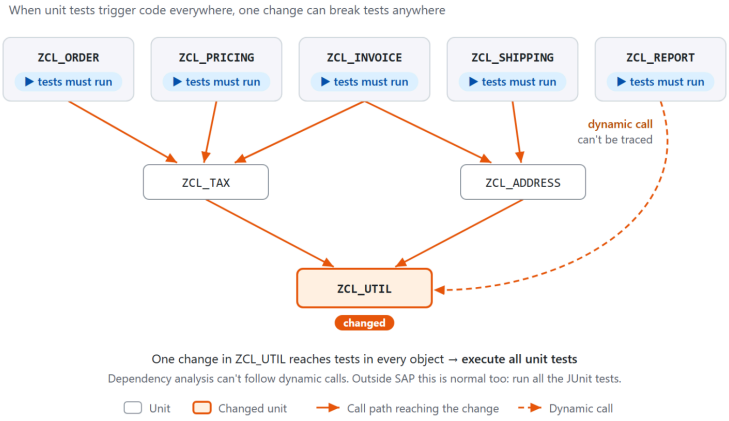

What is a unit?

I care less about the definition than about finding bugs early. I write integration tests, which execute multiple units, using the ABAP Unit framework. You *can* add dependency injection and mocks everywhere, but in my experience running the real code where possible finds more bugs, earlier.

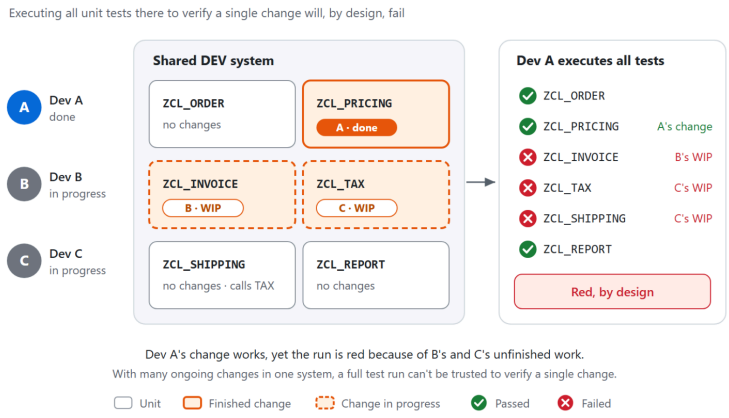

Which tests to execute?

If tests exercise code across many objects, you have to run all of them, or do heavy dependency analysis, which still can't resolve dynamic calls. That's normal outside SAP too: run all the JUnit tests to check the change works.

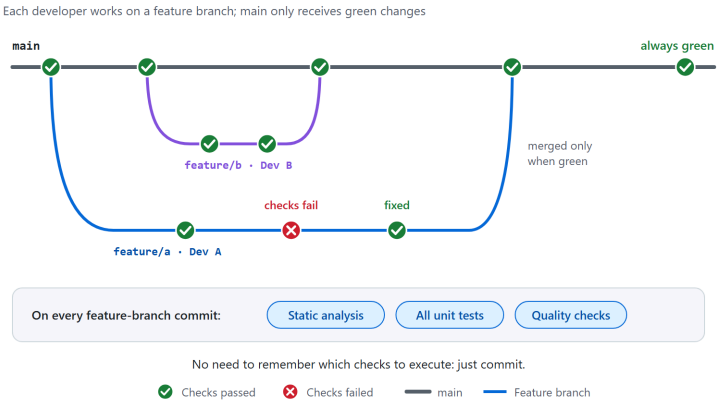

However, ABAP development traditionally happens in one central development system, where many developers have changes in progress at once. Run all the tests there and they will fail by design. Someone else's half-finished change breaks a test that has nothing to do with yours.

Isolate the changes

Isolate your ABAP changes to git, then it becomes possible to do real trunk based development where the main branch is always green. The developer doesn't need to remember what quality checks to execute, just commit the changes to the feature branch and it will trigger static analysis and quality checks!

Unit test results will provide feedback for the change(pull request), not the aggregated set of ongoing changes in the development system.

Design the process for success. The tools will occasionally break, but a broken tool is easy to fix. A broken process isn't.
