abaplint-abap-classic

abaplint in ABAP for ABAP on ABAP

Lars Hvam Petersen
Senior SAP/ABAP Consultant at Heliconia Labs

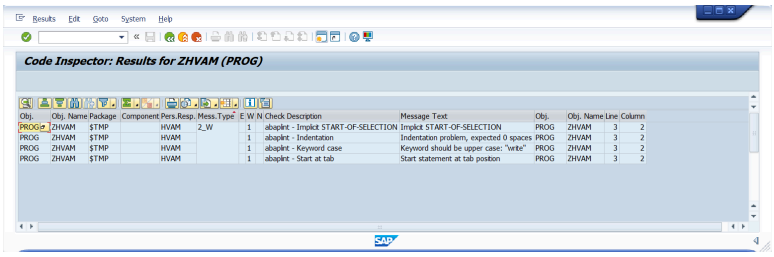

October 17, 2026

TLDR: most of abaplint can now run on-stack in Code Inspector or ATC

For the last 10 years, abaplint has worked great for checking files on GitHub or in a off-stack approach, but its not been working very well with SAP integrated tools, until today.

https://github.com/abaplint/abaplint-abap-classic is 1½ million lines of ABAP code generated from the abaplint TypeScript source code. It's now possible to install it into a system via abapGit, and enable the rules in your code inspector variant.

This means its now possible to get consistent results across all major ABAP editors, both in off-stack and on-stack setups. Trigger code inspector from SE80 and it should show results similar to whats reported from Continuous Integration on GitHub.

Example code inspector output

Out of the 217 abaplint rules, 140 of them now runs on stack, more will be enabled in the future. However, something like the "syntax_check" and "parser_error" rules will probably not be enabled, because the on-stack native SAP checks are correct and faster and better 😅

Thanks to Alice Vinogradova for helping out.

Currently only default rule configurations are supported, and there will be changes and bugs, but also feel free to try it out
